# Tango REST API RC4

There are three parts in this proposal: URL specification; Implementation remarks; Implementation recommendations. The first one names valid URLs that must be handled by the implementation. Each URL is presented following this format:

URL	RESPONSE TYPE	NOTE
<code>METHOD url</code>	JSONArray/JSONObject/NULL	short comment

Such table is followed by a JSON response's examples block:

```
URL : { 'JSON response' : 'example' }
```

In two following sections several implementation guidelines are highlighted.

In general API follows standard CRUD idiom:

HTTP verb	CRUD	collection	instance
GET	READ	Read a list. 200 OK	Read the details of one instance. 200 OK
POST	CREATE	Create a new instance. 201 OK	-
PUT	UPDATE/CREATE	Full Update. 200 OK	Create an instance. 201 Created
DELETE	DELETE	-	Delete instance. 200 OK

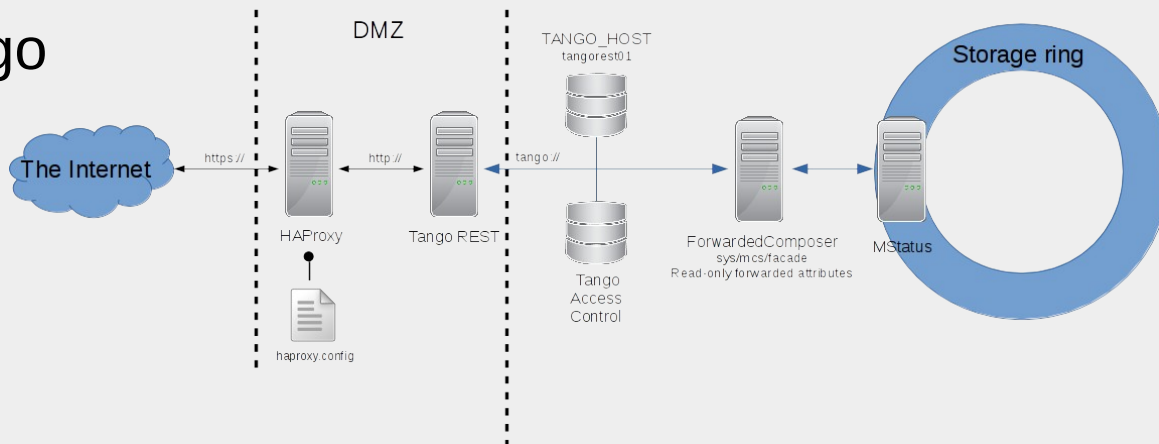

POST create an instance of collection by the URI of this collection. POST returns the URI and the id of the newly created instance.

## URL example driven specification:

All URLs in this section omit protocol//host:port part: `http://host:port`. An implementation may or

# Tango REST API status report

- Migration to GitHub
- Read the Docs
- Updates (RC4)
- Added to the official Tango documentation
- ESRF deployment
- DESY deployment
- JINR deployment

# Roadmap (main points)

- RC5
  - TANGO\_HOST port as a matrix parameter:  
tango/rest/rc4/hosts/orion/10000/... VS tango/rest/rc5/hosts/orion/...  
OR tango/rest/rc5/hosts/orion;port=10005/...
  - Content-type VS URL addressing:  
.../attributes/ushort\_image/value/image VS .../value Content-type: image/jpeg  
.../attributes/ushort\_image/value/plain VS .../value Content-type: text/plain
- RC6
  - HTTP/2  
push events!!!

### mTangoREST.server / Home

## Getting started with mTangoREST.server

Download latest mTangoREST.server zipped war or jar file from [downloads](#)

.war

Unzip and place it into your servlet container's webapps folder (`{CATALINA_HOME}/webapps`). Restart the container. If everything is fine you should notice something like the following output in the log:

```
TangoRestServer has been initialized.
[2015-03-05 03:54:31,112] Artifact tango:war: Artifact is deployed successfully
[2015-03-05 03:54:31,113] Artifact tango:war: Deploy took 2 338 milliseconds
```

To be 100% sure that mtango.server is properly deployed open your browser and type in the address bar `http://localhost:8080/tango/rest`. An authorization popup will appear, to pass the authorization you should define user(s) with role(s) mtango-rest, mtango-admin (\*) in the servlet container (see `{CATALINA_HOME}/conf/tomcat-users.xml`). You should see a list of supported Tango REST API versions list:

```
{
  "rc3":"http://localhost:8080/tango/rest/rc3"
}
```

(\*) This one is used to access mTango admin panel. If you do not plan to use it (it is not required for this tutorial) just skip this role.

.jar

Download the latest mtango.server .jar.

Define TangoRestServer device in the Tango DB:

jive 4.31 [hzgxenvtest:10000]

Class	Alias	Att. Alias	Property
Server			Device
DataBases			
DataFormatAdapter			

»

# mtangorest.server

- Latest release rc4-1.4
- RC4
  - Image (2D array) data types
  - Event mechanism tweaks
- Refactoring (JAX-RS)
- Consistent http response codes (305, 500, 503)
- Docker container
- Bug fixes
  - No filter configured with id 'json-response-fields-filter'
  - Events wrong response
